

ACCESS CONTROL AND DIGITAL RIGHTS MANAGEMENT (DRM)

These are two important concepts in computer security and digital content protection

ACCESS CONTROL

Access control is the process of deciding who is allowed to access a system, file, network or resources and what they are allowed to do with it.

Access control answers questions like:

Who can enter?

Who can they view?

Can they edit, copy or delete it?

Example of access control:

1. A school portal where only students can view their results.
2. A phone locked with a password or fingerprint.
3. A computer folder that only the owner can open.

COMMON TYPES OF ACCESS CONTROL

1. Authentication: checking identity (password, pin, fingerprint)
2. Authorization: deciding permissions (read, write, delete)

DIGITAL RIGHTS MANAGEMENT (DRM)

It is a technology used to protect digital content from unauthorized copying, sharing or use.

This is mostly used for: movies, music, ebooks, software, video games.

Examples of digital rights management:

1. Netflix prevents users from downloading movies illegally
2. An ebook may stop users from copying text.
3. A paid software requires a license key before it can work.

Digital rights management (DRM) uses technologies like:

Encryption, license key, device restriction, expiry dates, copy protection.

DIFFERENCE BETWEEN ACCESS CONTROL AND DIGITAL RIGHTS MANAGEMENT (DRM).

Access control	Digital rights management DRM
Controls who can access a system or resources	Controls how a digital content is used after access
used in network file system	used for media software and digital products
Focuses on permission	Focuses on copyright protection

Conclusion:in conclusion access control and digital rights management (DRM) wlare essentials for protecting digital systems and content in today's technology-driven.Access control ensures that only authorized use, copying or distribution.
